

1. Scholarship Eligibility (Student Structure)

Define a structure **Student** with members: name, id, cgpa, and creditsCompleted.

Write a C program to input data for n students, check if each student is eligible for a scholarship (criteria: $\text{cgpa} \geq 3.75$ and $\text{creditsCompleted} \geq 30$), and display the list of eligible students.

2. Bookstore Revenue (Book Structure)

Define a structure **Book** with members: title, author, price, and copiesSold.

Write a C program to input details of n books, calculate the **total revenue** for each book ($\text{price} \times \text{copiesSold}$), and display the book with the **highest revenue**.

3. Bank Account System

Define a structure **Account** with members: accountNumber, holderName, balance.

Write a program to input details of n accounts and then:

- Deposit a given amount into a selected account.
- Withdraw a given amount (only if balance is sufficient).
- Display account details after transactions.

4. Cricket Player Statistics

Define a structure **Cricketer** with members: name, matches, runs, wickets.

Write a program to input details of n players and find:

- The player with the **highest runs**.
- The player with the **most wickets**.

5. Hospital Patient Record

Define a structure **Patient** with members: name, age, disease, daysAdmitted.

Write a program to input data for n patients and calculate the **average number of days admitted**. Display patients who stayed for more than the average.

6. Product Inventory Management

Define a structure **Product** with members: id, name, price, quantity.

Write a program to input details of n products and:

- Calculate the total inventory value (price $\times$ quantity).
- Display the product with the **lowest stock**.

7. Movie Ratings

Define a structure **Movie** with members: title, director, rating, releaseYear.

Write a program to input details of n movies and display:

- All movies released after 2015.
- The movie with the **highest rating**.

8. Airline Reservation System

Define a structure **Passenger** with members: name, flightNo, ticketPrice, distance.

Write a program to input details of n passengers and apply a discount on ticket price:

- Distance > 1000 km $\rightarrow$ 20% discount
 - Distance > 500 km $\rightarrow$ 10% discount
 - Otherwise $\rightarrow$ No discount
- Display the final ticket prices.
